

Setting Up a Training Tenant & Subscription for 14 Students

A step-by-step guide using one centrally managed Microsoft Entra tenant and one Azure subscription. Updated for the current Azure portal / Microsoft Entra admin center UI (August 2026), with screenshot placeholders for each key step.

Yes. Below is the cleanest way to set this up from scratch for 14 students using one centrally managed Microsoft Entra tenant and one Azure subscription.

The key point first: **the tenant is for identities; the Azure subscription is for billing/resources**. So you will create the tenant, create 14 student users inside it, then make sure the training subscription is associated with that tenant, create one resource group per student, and assign each student Contributor only to their own resource group.

UI UPDATE (2026): Microsoft Entra ID identity management now lives primarily in its own admin center at entra.microsoft.com, separate from the classic Azure portal (portal.azure.com). Both work side by side — you can still reach every Entra screen by searching "Microsoft Entra ID" from the Azure portal's top search bar — but Microsoft's own documentation now points to entra.microsoft.com first. Screens, menu names, and the navigation paths below are otherwise unchanged.

Microsoft's current guidance says a new workforce tenant is created from Microsoft Entra ID → Overview → Manage tenants → Create, choosing Microsoft Entra ID rather than B2C.

Step 1 — Confirm you have a paid Azure subscription

Before creating the tenant, sign in to the Azure portal with the account that owns or administers the subscription you plan to use for training.

Check:

Azure Portal → Subscriptions → Select your subscription

Make sure the subscription status is Active.

SCREENSHOT PLACEHOLDER

Step 1 — Subscriptions list showing status = Active

This matters because Microsoft currently states that creating an additional workforce tenant is generally available to paid customers with the necessary billing/ARM permissions; trial/free tenants may not be able to create additional workforce tenants.

Step 2 — Create the Microsoft Entra tenant

Go to:

<https://portal.azure.com> — or go directly to <https://entra.microsoft.com>, the dedicated Microsoft Entra admin center.

Then:

Microsoft Entra ID → **Overview** → **Manage tenants** → **Create**

Choose:

Microsoft Entra ID

Do not choose B2C for this training setup. You need a normal workforce tenant. Depending on your tenant's governance features, you may also see an External or Governed Workforce option on this screen — ignore those for a standard training tenant and pick Microsoft Entra ID.

SCREENSHOT PLACEHOLDER

Step 2 — "Manage tenants" screen with the Create button, and the tenant-type selection (Basics tab)

Enter something like:

Organization name:

Cloud Data GenAI Training

Initial domain name:

cloudgenaitraining26

Country/Region:

India

Your resulting tenant domain will look like:

cloudgenaitraining26.onmicrosoft.com

The initial onmicrosoft.com domain is permanent, so choose the name carefully.

SCREENSHOT PLACEHOLDER

Step 2 — Configuration tab with Organization name, Initial domain name, Country/Region filled in

Then:

Review + Create → **Create**

Step 3 — Switch into the new tenant

After creation:

Microsoft Entra ID → **Manage tenants**

Select your new tenant. Then choose:

Switch

You should now see something similar to:

Tenant name: Cloud Data GenAI Training
Primary domain: cloudgenaitraining26.onmicrosoft.com
Tenant ID: xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx

Save the Tenant Name, Tenant ID, and Primary Domain. You will need these later.

SCREENSHOT PLACEHOLDER

Step 3 — Tenant Overview page after switching, showing Tenant name / Primary domain / Tenant ID

Step 4 — Understand what you currently have

At this point, the architecture looks like:

Your Microsoft Account

Microsoft Entra Tenant — cloudgenaitraining26.onmicrosoft.com

- No students yet
- No training resources yet

The next step is to create the 14 users.

Step 5 — Create Student 01 manually first

Before doing a bulk import, I recommend creating one account manually and testing it.

Go to:

Microsoft Entra ID → Users → All users → New user → Create new user

Enter:

User principal name: student01@cloudgenaitraining26.onmicrosoft.com

Display name: Student 01

Password: Auto-generate password

or create a temporary password that meets the tenant's current password requirements.

Enable: Require password change at next sign-in

if available/appropriate for your lab.

SCREENSHOT PLACEHOLDER

Step 5 — "Create new user" form with UPN, display name, and password settings

Then click:

Review + Create

Step 6 — Test Student 01 login

Open an Incognito/InPrivate browser.

Go to: <https://portal.azure.com>

Login as: student01@cloudgenaitraining26.onmicrosoft.com

Use the temporary password.

The student may be asked to:

- Change password
- Register MFA
- Accept security information

depending on your tenant/security policies.

At this stage, the student can authenticate, but will probably not yet have access to Azure resources. That is expected.

Step 7 — Create all 14 students using Bulk Create

For 14 users, bulk creation is much faster than manually creating all of them.

Microsoft Entra supports bulk creation through:

Entra ID → Users → Bulk create

and Microsoft currently requires at least the User Administrator role for bulk user creation.

Go to:

Microsoft Entra ID → Users → Bulk operations → Bulk create

Depending on the portal view, it may simply show:

Users → Bulk create

Download the CSV template.

UI UPDATE (2026): The downloaded CSV template now starts with a required first row containing the template version (for example version:v1.0). Keep that row exactly as downloaded — don't delete or edit it — and add your student rows starting from row 4. Removing or altering it will cause the upload to fail validation.

Microsoft says the first four fields are required:

- Name
- User principal name
- Initial password

- Block sign in

SCREENSHOT PLACEHOLDER

Step 7 — "Bulk create" page with the Download template button and Upload panel

Step 8 — Prepare the 14-student CSV

Your CSV could conceptually look like this (columns: Name, User principal name, Initial password, Block sign in):

Student 01,student01@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2601,No
Student 02,student02@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2602,No
Student 03,student03@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2603,No
Student 04,student04@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2604,No
Student 05,student05@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2605,No
Student 06,student06@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2606,No
Student 07,student07@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2607,No
Student 08,student08@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2608,No
Student 09,student09@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2609,No
Student 10,student10@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2610,No
Student 11,student11@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2611,No
Student 12,student12@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2612,No
Student 13,student13@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2613,No
Student 14,student14@cloudgenaitraining26.onmicrosoft.com,Temp@Azure2614,No

But important: use Microsoft's downloaded CSV template and preserve the exact column headers (and the version row noted above). Microsoft explicitly warns that the bulk file must match the provided template.

Also, I would not use the example passwords above in a real class. Generate strong unique temporary passwords and distribute them privately.

Step 9 — Upload the CSV

Go back to:

Microsoft Entra ID → Users → Bulk create

Upload the CSV. Wait for: File uploaded successfully

Then: Submit

SCREENSHOT PLACEHOLDER

Step 9 — Bulk create job status showing "File uploaded successfully" / job progress

After completion:

[Microsoft Entra ID](#) → [Users](#) → [All users](#)

Verify: Student 01 ... Student 14

Microsoft notes that bulk-created internal users do not automatically receive invitation emails, so you need to share credentials yourself.

Step 10 — Make the Azure subscription available in this tenant

This is the part that often causes confusion. You need:

Training Tenant → Azure Subscription

If the subscription is already associated with this new tenant, great.

Go to:

[Azure Portal](#) → [Subscriptions](#)

Check whether your subscription is visible.

If the subscription is still associated with another directory, you may need to change the subscription's directory/tenant. Be careful here because changing directories can affect RBAC assignments and service identities.

For your training environment, confirm this before creating resources.

SCREENSHOT PLACEHOLDER

Step 10 — Subscriptions blade confirming the training subscription's Directory = your new tenant

The end result should be:

[cloudgenaitraining26.onmicrosoft.com](#) → **Training Subscription**

Step 11 — Create 14 Resource Groups

Now create one Resource Group per student. Use:

rg-cdg-s01

rg-cdg-s02

rg-cdg-s03

...

rg-cdg-s14

I recommend not putting day01 in the RG name if you plan to use the same student RG across the full training. For example, inside rg-cdg-s01 later: Day 1 resources, Day 2 resources, Storage, VMs, App Service, etc.

This is easier to manage than creating 14 new RGs every single day.

Step 12 — Create Resource Groups from the Portal

Go to:

Azure Portal → **Resource Groups** → **Create**

Select:

Subscription: Your Training Subscription

Resource Group: rg-cdg-s01

Region: Central India

Then: Review + Create → Create

Repeat through rg-cdg-s14.

SCREENSHOT PLACEHOLDER

Step 12 — "Create a resource group" blade with subscription, name, and region filled in

Step 13 — Faster method: create all 14 with Azure CLI

You can use Cloud Shell. Example:

```
for i in $(seq -w 1 14)
do
  az group create --name rg-cdg-s$i --location centralindia
done
```

That creates rg-cdg-s01, rg-cdg-s02, ... rg-cdg-s14. This saves significant time.

Step 14 — Assign Student 01 to Resource Group 01

Open:

Resource Groups → **rg-cdg-s01** → **Access Control (IAM)**

Then:

Add → **Add role assignment**

Select role:

Contributor

Then:

Members → **User, group, or service principal** → **Select members**

Search: student01

Select: student01@cloudgenaitraining26.onmicrosoft.com

Then: Review + assign

SCREENSHOT PLACEHOLDER

Step 14 — Access control (IAM) → Add role assignment blade, with Contributor role and student01 selected as member

Microsoft's current RBAC guidance uses exactly this flow: select the target scope, open Access control (IAM), then Add → Add role assignment.

Step 15 — Repeat for the 14 students

Use this mapping:

Student	Account	Resource Group
01	student01@tenant	rg-cdg-s01
02	student02@tenant	rg-cdg-s02
03	student03@tenant	rg-cdg-s03
04	student04@tenant	rg-cdg-s04
05	student05@tenant	rg-cdg-s05
06	student06@tenant	rg-cdg-s06
07	student07@tenant	rg-cdg-s07
08	student08@tenant	rg-cdg-s08
09	student09@tenant	rg-cdg-s09
10	student10@tenant	rg-cdg-s10
11	student11@tenant	rg-cdg-s11
12	student12@tenant	rg-cdg-s12
13	student13@tenant	rg-cdg-s13
14	student14@tenant	rg-cdg-s14

Each student gets Contributor at Resource Group Scope — not Subscription Scope.

Step 16 — Why Contributor and not Owner?

Use Contributor because students need to:

- Create resources

- Update resources
- Delete resources
- Configure resources

But they generally should not be allowed to give RBAC access to other users.

So: Student → Contributor → Own Resource Group

is safer than: Student → Owner → Subscription

Step 17 — Test with Student 01

Open Incognito. Sign in: student01@cloudgenaitraining26.onmicrosoft.com

Then go to: Resource Groups

Student 01 should see/access: rg-cdg-s01

Now test creating a Storage Account or a simple tag/resource.

Student 01 should not be able to administer rg-cdg-s02.

SCREENSHOT PLACEHOLDER

Step 17 — Student 01's Resource Groups view, showing only rg-cdg-s01

Step 18 — Final architecture

You should end up with:

Microsoft Entra Tenant — cloudgenaitraining26.onmicrosoft.com

- Trainer / Global Admin
- Student01
- Student02
- Student03
- ... through Student14

Azure Training Subscription

- rg-cdg-s01 → Contributor → Student01
- rg-cdg-s02 → Contributor → Student02
- rg-cdg-s03 → Contributor → Student03
- rg-cdg-s04 → Contributor → Student04

- rg-cdg-s05 → Contributor → Student05
- rg-cdg-s06 → Contributor → Student06
- rg-cdg-s07 → Contributor → Student07
- rg-cdg-s08 → Contributor → Student08
- rg-cdg-s09 → Contributor → Student09
- rg-cdg-s10 → Contributor → Student10
- rg-cdg-s11 → Contributor → Student11
- rg-cdg-s12 → Contributor → Student12
- rg-cdg-s13 → Contributor → Student13
- rg-cdg-s14 → Contributor → Student14

Step 19 — What students receive

Send each student only:

Azure Portal: <https://portal.azure.com>

Username: student01@cloudgenaitraining26.onmicrosoft.com

Temporary Password: *****

Resource Group: rg-cdg-s01

Instructions:

- Login
- Change password if prompted
- Complete MFA if prompted
- Use only your allocated Resource Group
- Do not create another subscription
- Do not enter debit/credit card details
- Do not modify IAM
- Do not create expensive resources without trainer approval

Step 20 — Cost controls to configure before giving access

Because all 14 students consume the same paid subscription, do this before class.

Go to:

Cost Management + Billing → Cost Management → Budgets

Create a budget. For example: Monthly Training Budget

Set alerts at something like: 50%, 75%, 90%, 100%

SCREENSHOT PLACEHOLDER

Step 20 — Budgets blade with a new monthly budget and alert thresholds configured

Also tell students to avoid arbitrary SKUs. For Day 1, restrict them to the tier you specify.

Later, particularly for VM, Databricks, AKS, Azure SQL, and AI services, you should be even more careful because 14 simultaneous environments can consume substantial credit.

Step 21 — Strong recommendation for your 45-day course

For basic Azure labs, give every student their own resources: Storage, VM, VNet, App Service, etc.

But later for expensive services such as Azure Databricks, Azure AI Foundry, Azure AI Search, New Relic integrations, and Synapse, I would not automatically create 14 independent full environments.

Instead consider:

Training Subscription

- 14 student Resource Groups → low-cost individual labs
- Shared Trainer Resource Group → Shared Databricks Workspace, Shared ADLS, Shared datasets, Shared AI Search, Shared AI services

and give students appropriate workspace-level/access permissions. That can reduce cost dramatically.

The first thing you should do now

Don't create all 14 users immediately. First do this sequence:

- Create Tenant
- Create Student01
- Confirm subscription is visible in that tenant
- Create rg-cdg-s01
- Give Student01 Contributor
- Login as Student01
- Create one small resource

Once that succeeds end-to-end, bulk-create Students 02–14.

This avoids discovering a tenant/subscription/RBAC problem after you've already configured all 14 accounts.

Send screenshots as you perform these steps and drop them into the placeholders above — that keeps this guide as an accurate, visual record of your specific tenant/subscription setup.
